

Hi everyone,

I'm excited to share my project: the 'DEV DETECTIVE' application. I created it using the GitHub API. This application lets you fetch user details directly from GitHub using **HTML**, **CSS**, and **JavaScript**.

With this application, you can effortlessly search for any user on GitHub and view their profile information, including their name, bio, followers, and repositories. The user-friendly application provides a straightforward interface for interacting with the **GitHub API**.

I'm thrilled with the results of this project, and it can be a valuable tool for developers and non-developers alike who want to quickly and easily access information from GitHub. Plus, it was an excellent opportunity to improve my HTML, CSS, and JavaScript skills.

If you want to try the application, check out the live demo on my **Netlify page**. I hope you find it as valuable and enjoyable as I created it.

Please feel free to reach out if you have any feedback or suggestions. I'm always looking for ways to improve and make my projects even better.
